

IN THE CLAIMS:

1. (Currently Amended) A mining member provided as a cutting roller for a continuously operating surface miner for mining mineral raw materials possessing solid and abrasive properties, the mining member comprising:

5      a cylindrical or substantially cylindrical roller basic body for providing a cutting roller support;

        a drive for ~~[[the]]~~ rotating said roller basic body;

        supports fastening ~~[[the]]~~ said roller basic body to the surface miner;

        a roller jacket ~~connected to the~~ disposed around said roller basic body, ~~[[the]]~~ said jacket having mini-disk bits arranged in rolling paths, and conveying screws having opposite  
10      pitches and extending from two edges of the roller to the middle of the roller to form two roller halves, which are symmetrical to one another providing a mineral raw material cutting roller for block cutting with a larger middle area forming a mining front joined on both sides by edge areas, the cutting roller rolling paths providing a circumferential interface with a middle cylinder joined on both sides by outwardly tapering frusta, said frusta having a length equal to  
15      at least 0.25 of a mining height ( $H_{\text{scr}}$ ), and said conveying screws on the roller halves being arranged symmetrically with respect to said circumferential interface, and said conveying screws on one of the roller halves being arranged offset in relation to ~~[[the]]~~ said conveying screws on the other roller half by an amount and ~~sides of the conveying screws pointing to the middle of the cutting roller equipped with said mini-disk bits are provided~~ either directly on  
20      or after sides of said conveying screws pointing to the middle of the cutting roller ~~them~~ in the

direction of rotation of the roller, wherein [[the]] a driving wedge flank[[s]] of [[the]] each of  
said mini-disk bits are directed against each other in the middle cylinder wall area of the two  
 roller halves and [[the]] said mini-disk bit on the two both sides of said frusta is directed  
 inwardly, and [[the]] said mini-disk bits arranged at the two outer edges are free-cutting bits,  
 5 which point toward the outside with their wedge flanks.

2. (Currently Amended) A cutting roller in accordance with claim 1, wherein said  
 mini-disk bits on said two halves of the middle cylinder wall area adjacent said [[are]]  
 conveying screws are selected with a path distance that is determined according to the  
 following equation:

$$t_B = p_B \cdot \eta_m,$$

where  $p_B$  can be assumed to equal 15-20 mm and  $\eta_m$  can be assumed to equal 3-4 for  
 solid and brittle earth materials and  $\eta_m = 3.5-5$  for solid and tough earth materials.

3. (Currently Amended) A cutting roller in accordance with claim 1, wherein a density  
 of [[the]] said mini-disk bits in the two edge areas on the frustum length ( $L_{RB}$ ) is at least twice  
 the number of [[the]] said mini-disk bits in the middle wall area  $L_M$ , and [[the]] said conveying  
 screws on the frustum length ( $L_{RB}$ ) are higher by the depth of penetration of [[the]] said mini-  
 5 disk bits in the two edge areas on the frustum length ( $L_{RB}$ ) than [[the]] said conveying screws  
 and [[the]] a set of additional conveying screws in the middle wall area ( $L_M$ ).

4. (Currently Amended) A cutting roller in accordance with claim 1, wherein ~~that the~~ said roller body is equipped on its frustum areas with a set of additional conveying screws and ~~[[the]]~~ a set of free-cutting mini-disk bits in the outer rolling path are arranged at an angle that is equal to or greater than the angle of the outer wedge flank of ~~[[the]]~~ said mini-disk bit sloped toward the outside.

5  
5. (Currently Amended) A cutting roller in accordance with claim 1, wherein ~~[[the]]~~ said conveying screws extend over the entire length of the respective roller half.

6. (Currently Amended) A cutting roller in accordance with claim 1, wherein two said mini-disk bits are arranged in pairs on a common bit holder, and ~~[[the]]~~ said bit holders are arranged either directly ~~on the cutting roller or on~~ [[the]] said conveying screws ~~[[turns]]~~ and ~~[[said]] a set of~~ additional conveying screws or behind ~~the cutting roller or on the~~ said conveying screws ~~[[turns]]~~ and said additional conveying screws in the direction of rotation of the roller and the distance between ~~[[the]]~~ said wedge flanks of ~~[[the]]~~ said mini-disk bits of one pair is also ~~[[the]]~~ a cutting ~~[[line]]~~ path distance.

7. (Currently Amended) A cutting roller in accordance with claim 1, wherein to obtain different path distances of ~~[[the]]~~ said mini-disk bits belonging to one pair, ~~[[said]] a set of~~ axes of adapted lengths are used.

8. (Currently Amended) A cutting roller for a continuously operating surface miner for mining mineral raw materials of high strength, the cutting roller comprising:

a roller body with conveying screws having opposite pitches and extending from two respective edges of the roller to the middle of the roller to form roller halves with a set of conveying screws on one of the roller halves being arranged offset in relation to [[the]] said conveying screws on the other roller half and with mini-disk bits mounted on each conveying screw to form rolling paths with said mini-disk bits at edge areas placed at a greater density than mini-disk bits in a middle area, with [[the]] said mini-disk bits at the two outer edges of the cutting roller being directed obliquely toward the outside as free-cutting bits, [[the]] said mini-disk bits having a mining height with the rolling paths together forming a virtual cutting roller body having a middle cylinder joined on both sides by outwardly tapering frusta, said frusta having a length equal of at least 0.25 of said mining height

9. (Currently Amended) A cutting roller in accordance with claim 8, wherein said mini-disk bits are on conveying screws with a path distance that is determined according to the following equation:

$$t_B = p_z \cdot \eta_m,$$

where  $p_z$  can be assumed to equal 15-20 mm and  $\eta_m$  can be assumed to equal 3-4 for solid and brittle earth materials and  $\eta_m = 3.5-5$  for solid and tough earth materials.

10. (Currently Amended) A cutting roller in accordance with claim 8, wherein a

density of [[the]] said mini-disk bits in the two edge areas on the frustum length ( $L_{RB}$ ) is at least twice the number of [[the]] said mini-disk bits in the middle wall area  $L_M$ , and [[the]] said conveying screws on the frustum length ( $L_{RB}$ ) are higher by the depth of penetration of [[the]]  
5 said mini-disk bits in the two edge areas on the frustum length ( $L_{RB}$ ) than [[the]] said conveying screws and [[the]] a set of additional conveying screws in the middle wall area ( $L_M$ ).

11. (Currently Amended) A cutting roller in accordance with claim 8, wherein ~~that the~~ said roller body is equipped on its frustum areas with a set of additional conveying screws and [[the]] a set of free-cutting mini-disk bits in the outer rolling path are arranged at an angle that is equal to or greater than the angle of the outer wedge flank of [[the]] said mini-disk bit sloped  
5 toward the outside.

12. (Currently Amended) A cutting roller in accordance with claim 8, wherein [[the]] said conveying screws extend over the entire length of the respective roller half.

13. (Currently Amended) A cutting roller in accordance with claim 8, wherein two said mini-disk bits are arranged in pairs on a common bit holder, and [[the]] said bit holders are arranged either directly ~~on the cutting roller or on~~ [[the]] said conveying screws [[turns]] and [[said]] a set of additional conveying screws or behind ~~the cutting roller or on the said~~ conveying screws [[turns]] and said additional conveying screws in the direction of rotation  
5 of the roller and the distance between the wedge flanks of [[the]] said mini-disk bits of one pair

is also ~~[[the]]~~ a cutting ~~[[line]]~~ path distance.

14. (Currently Amended) A cutting roller in accordance with claim 8, wherein to obtain different path distances of ~~[[the]]~~ said mini-disk bits belonging to one pair, ~~[[said]]~~ a set of axes of adapted lengths are used.

15. (Currently Amended) A cutting roller member for a surface miner for mining mineral raw materials possessing solid and abrasive properties, the cutting roller member comprising:

a drive;

5 surface miner supports;

a roller jacket, connected to said supports and driven by said drive;

a first side conveying screw extending from a first roller jacket edge to the middle of said roller jacket;

10 a second side conveying screw extending from a second roller jacket edge to the middle of said roller jacket, said second side conveying screw having a pitch that is opposite a pitch of said first side conveying screw and being offset so as to not intersect in the middle;

15 a set of mini-disk bits providing a mining height, said mini-disk bits being arranged in roller paths along said first conveying screw and said second conveying screw, said mini-disk bits forming a virtual cutting roller body with a symmetrical profile having a cylindrical middle area and frusta shaped at each side of the virtual cutting roller body with reduced radial

dimension at side edges of the virtual cutting roller body, each said frusta having an axial length that is at least a quarter of the mining height, said mini-disk bits in said cylindrical middle wall area having wedge flanks in one half of said cylindrical middle wall area directed outwardly and opposite wedge flanks in the other half of said cylindrical middle wall area and  
 20 each respective wedge flank for said mini-disk bits in each frusta area being directed inwardly, and mini-disk bits at said side edges being free-cutting bits with wedge flanks directed outwardly.

16. (Currently Amended) A cutting roller member in accordance with claim 15, wherein said mini-disk bits on said two halves of the cylindrical middle wall area adjacent said [[are]] conveying screws are selected with a path distance that is determined according to the following equation:

5 
$$t_B = p_Z \cdot \eta_m,$$

where  $p_Z$  can be assumed to equal 15-20 mm and  $\eta_m$  can be assumed to equal 3-4 for solid and brittle earth materials and  $\eta_m = 3.5-5$  for solid and tough earth materials.

17. (Currently Amended) A cutting roller member in accordance with claim 15, wherein a density of [[the]] said mini-disk bits in the two edge areas on the frustum length ( $L_{RB}$ ) is at least twice the number of [[the]] said mini-disk bits in the middle wall area  $L_M$ , and [[the]] said conveying screws on the frustum length ( $L_{RB}$ ) are higher by the depth of penetration  
 5 of [[the]] said mini-disk bits in the two edge areas on the frustum length ( $L_{RB}$ ) than [[the]] said conveying screws and [[the]] a set of additional conveying screws in the middle wall area ( $L_M$ ).
